

Grinta for Life × Greg Welk

Authoring Brief – v1.3

Date: May 2026

Version: 1.3

How to read this brief

This document proposes what Greg will author, why each piece matters, where each piece lives in the Member Agent architecture, what the delivery cadence is against the platform launch in October 2026, and what the working agreement is on voice, attribution, and the McGraw Hill relationship.

Why this brief exists

Grinta for Life is the Impact Campaign extension of GRINTA! Film. The framework, the Atlas of 28 proposed assets, the Identity Distance Questionnaire, the ID Score, and the Member Agent are all live or in active build. The second edition of the book *Grinta for Life* delivers publicly later in June 2026.

This addresses addition of the Member Agent's science layer with custom content authored by co-founder, Dr. Greg Welk. It will be Greg-authored originals that draw on his body of work, are written for midlife audiences (not college students), and live as a structured corpus the Member Agent retrieves in member conversations.

This brief defines all deliverables that together constitute Greg's science contribution to the Custom Platform. The deliverables are scoped to land before the October platform launch, with the second-edition Foreword for *Grinta for Life* book.

The architectural decision: Path A

Three paths were considered for integrating Greg's body of work into the Member Agent corpus:

- Path B would have required negotiated licensing with McGraw Hill to use textbook chapters directly. Not pursued — Greg has a long-standing relationship with McGraw Hill and the working principle is to honor their policies.
- Path C would have been a hybrid of Greg-authored originals plus short attributed quotations from the textbook. Possible later if specific quotations merit the effort; not needed for v1.0.
- **Path A — Greg-authored G4L originals — is the working plan.** Greg writes new content drawing on his own intellectual contributions to the textbook and his broader applied science work. The textbook becomes a reference, cited but not reproduced. The content is voiced for G4L from the start, not adapted from college-student material.

There are three deliverables for the G4L Program Member Agent Corpus:

Greg's Y1 contribution to the Program consists of distinct deliverables. Each has a defined purpose, a target length, and a known retrieval pattern inside the Member Agent.

1 & 2. G4L Member Agent-Facing Concept Map Content and Member-Facing Science Checks

Same source material, two different audiences, with a one-to-one mapping at the gating-asset level.

The Concept Map is upstream — the agent's reference document. Greg-authored, 10-15 pages, G4L-keyed, organized by Phase → Layer → gating asset. The Member Agent reads from it but does not show it to the Member directly. When a Member's conversation enters a Phase or gating asset that needs science framing, the Member Agent retrieves the relevant Concept Map entry and uses it to inform the agent's reflect-and-route response. The agent speaks in G4L voice, references Greg's work as the authority, but does not impersonate Greg.

The 12 Science Checks are downstream — the Member-facing surfaced version. Greg-signed, ~200 words each, one per gating asset. They appear inside the asset view as Science Check Zones, rendered in Greg's voice. The Member reads Greg directly here. The Science Checks are the moment of contact between Greg's science and the Member — they land where the Member is already doing the work.

The link between them is a one-to-one mapping at the gating-asset level. The Concept Map has an entry for each of the 12 gating assets. The Science Check for the same gating asset is the 200-word distillation of that substrate, written for the Member rather than for the agent. Each of the 12 Concept Map gating-asset entries pairs with exactly one of the 12 Science Checks.

1. Concept Map Science Content – G4L-keyed, Member Agent Facing

Purpose. The reference document the Member Agent uses for the science behind "why the framework works this way".

What it is. This is the content that **informs the agent's response**. The Member Agent loads it into context when a Member's conversation enters a Phase or gating asset that requires science framing. Per the brief: "the science layer's spine" – the source the Member Agent draws on for the "why the framework works this way" reflect-and-route conversations.

G4L runs a Member Agent that surfaces science framing at specific moments in a Member's journey – when they enter an exercise, when they express doubt or resistance, when they finish and need help understanding what just happened. The science you write becomes the substrate the agent draws on at those moments. Members read the agent's output in the conversation surface and inside each exercise's asset view. The Member never sees your writing in its raw form. The agent reflects your work and translates it into the program's voice.

What we want from you. Write what you would naturally write about the science underneath each of the twelve gated assets. Write what you would for a colleague who needed to understand both the science and how it applies to a midlife adult who is reclaiming a self they have lost touch with. Roughly 300–500 words per asset. Include citations as you would normally include them – Corbin chapter pointers when they apply, peer-reviewed work when it serves, your own framing where the science benefits from your translation.

Plain prose. Word document, Google Doc, or whatever is fastest for you. One entry per exercise, headed with the Atlas code (R-1, R-4, R-6, etc.) so we can match them up cleanly. No structural fields, no tables, no required sections. If you want to flag something as your own framing rather than a textbook claim, mark it inline however you would mark it for a colleague. If you want to suggest a citation we should preserve, include it in your natural citation form. If you want to note that two of these exercises share a common underlying construct (cognitive reappraisal shows up in a few places, for example), say so inline and we will handle the cross-reference.

2. Science Checks –Member Facing

Purpose. Member-facing applied-science callouts, one per gating asset. The visible Greg voice inside the program. Where members and foundations see Greg-signed reasoning explaining why each gating asset is built the way it is.

Length. ~200 words each. Brief by design.

Audience. Members are midlife adults – most are between 45 and 65 – who have arrived at the program because they recognize a gap between who they are and a self they want back. Most are professionally accomplished and intellectually serious. None of them are looking for motivational pep talks. They're looking for honest science and a steady framework. Your prose can assume an educated reader who appreciates substance over rhetoric.

Your science gets surfaced to them through the Member Agent in the program's voice register – normalizing rather than corrective, reflective rather than prescriptive, measured rather than promotional. You don't need to write in that voice yourself. We will translate. Write in your voice..

The 12 gating assets. Each Science Check attaches to one gating asset (the asset that routes the member at a phase transition):

Phase	Layer	Gated Asset
Reconnect	Recognition Excavation Spark	R-1 IDQ R-4 Identity Excavation R-6 Window Exercise
Rewire	Awareness Visualization Hardiness	W-1 Disinformation Audit W-3 Visualization Workshop W-5 False Start Protocol
Rebuild	R-1 IDQ R-4 Identity Excavation R-6 Window Exercise	B-1 First Step Assessment B-3 First 1,000 Miles B-5 Fuel Plan
Reclaim	R-1 IDQ R-4 Identity Excavation R-6 Window Exercise	C-1 Reclaim Readiness Assessment C-3 Adventure Planning Worksheet C-5 Your Success Story

Retrieval. Each Science Check is retrieved when the Member Agent encounters the corresponding gating asset in a member's conversation, dashboard, or Tovuti experience.

How this fits into the program

The team has built a [six-section template](#) that will structure your writing for agent ingestion (Exercise Identity, Task-to-Science Mapping, Science Block, Retrieval Triggers, Agent Guidance, Metadata). But you aren't being asked to fill that template in. We'll translate your freeform writing into that structure on our side and bring the output back to you for sign-off. You review what we produced and confirm we represented your science faithfully. The structured templates then become the agent's corpus entries

Specifically you DO NOT need to think about:

- Which conversational signals should cause the agent to surface this science (Retrieval Triggers)
- Which keywords or moments should NOT trigger this science (Do-NOT-trigger conditions)
- How the agent should phrase the science when surfacing it (Agent Guidance, Tone, What to Avoid)
- Whether the science block is reusable across multiple exercises (we tag this on our side)
- Word count compression for Member-facing display (we distill from your prose)
- Per-exercise-part decomposition into sub-asset retrieval rows (we map this from your structure)

Write the science. Hand it to us. We'll do the rest.

As your entries land, the team translates each one into the six-section template. We write the Retrieval Triggers and Agent Guidance ourselves from your science block, and we bring the structured output back to you for review. Your review is a sanity-check pass: confirm we represented the science faithfully, flag anything we got wrong, sign off when right. Once signed off, the structured templates become Layer 2 corpus entries in the Member Agent's knowledge base and the agent can draw on them at the operating moments where they fire.

The 12 gating assets are the launch-priority scope. There are 28 assets in the full Atlas. Depending on how the Cycle 1 work lands and how much appetite the work generates on your end, we may extend the scope to the remaining 16 (mostly Depth-tier companions to the gating assets) post-launch. No commitment on the extended scope yet.

3. Topical Syntheses — 7 deep dives

Purpose. Longer-form Greg-authored pieces on specific subjects where the framework needs depth and where he has authoritative ground. These live as Atlas companion content (can be posts in Circle community) and as fuel for the Member Agent when conversations go deep on a topic.

Length. 1,500–3,000 words each, depending on subject.

The seven recommended to be in scope—to be finalized by Greg:

1. *Behavior change in midlife* — drawing on Chapters 3 (Self-Management Skills) and 17 (Stress-Management Strategies). The science of behavior change as it operates in the second half of life, not in the first.
2. *Self-management adapted for identity recovery* — drawing on Chapter 3. The Lorig and Holman model and the CDSMP framework reframed for midlife identity work, not chronic disease.
3. *SDT in the second half of life* — drawing on Chapters 3 and 7 (Adopting an Active Lifestyle). Autonomy, competence, and relatedness as they manifest after the kids leave, the career plateaus, and the body changes.
4. *Hardiness and grit* — cross-textbook. The two trainable capacities (weathering the storm vs. climbing after it). The Duckworth grit literature alongside the hardiness research. The conceptual ground under the brand word grinta.
5. *Physical activity assessment for midlife adults* — drawing on Chapters 4–6 (Preparing for PA, Health Benefits of PA, How Much Is Enough?). Greg's specialty. Anchors the IDQ Physical dimension and the dosing decisions in B-3 First 1,000 Miles.
6. *The Fuel Plan deep dive* — drawing on Chapters 14, 15, and 23 (Nutrition, Weight Control, Body Mechanics). The science underneath the five Fuel Plan components: Sleep, Nutrition, Recovery, Environment, Energy Tracking.
7. *The shortcut trap* — drawing on Chapter 24 (Making Informed Consumer Choices). The hidden gem. The citation-grade foundation for the Member Agent's reflect-and-route on biohacking, supplements, GLP-1, and longevity clinics. Anchors G4L's positioning against the wellness industry.

Retrieval. Each synthesis is retrieved when a Member Agent conversation goes deep on the corresponding topic. The agent reflects the content in G4L voice and routes the member to the full synthesis (or to a Greg AMA) when the depth warrants it.

4. Second Edition Foreword

Purpose. Front matter for the second edition of GRINTA FOR LIFE book. The Foreword is the longer-form Greg essay aimed at sophisticated readers – foundation officers, public health professionals, the press, and members who want the scientific grounding for what the program asks them to do.

Length. 2,500–4,000 words. Substantive but contained.

Posture. Greg's voice as the research partner standing alongside the founder. The argument: midlife identity loss is real, measurable, and reversible – and the framework G4L offers is the most evidence-grounded intervention available.

Timing. Drafted alongside the second edition production. Lands before the second edition goes to print.

There will be additional, ongoing marketing assets and participation in coaching, group calls, and marketing that are not detailed here.

Chapter-by-chapter mapping – seed table (needs to be updated to 14th edition)

The mapping below shows how each chapter in Corbin's Concepts of Fitness and Wellness could map into the G4L framework. This is seed work for the Concept Map – Greg will refine, formalize, and extend as he writes.

Strong-match chapters: 17 of 25. Moderate matches: 4. Out of scope: 4.

Ch	Textbook chapter title	G4L touchpoint
1	Health, Wellness, Fitness, and Healthy Lifestyles	Whole-framework framing
2	Determinants of Lifelong Health, Wellness, and Fitness	Doors framework + IDQ dimension design
3	Self-Management Skills for Health Behavior Change	KEYSTONE – Rewire foundations, SDT, CDSMP, Lorig & Holman
4	Preparing for Physical Activity	B-1 First Step Assessment, Seven Minutes ethos
5	The Health Benefits of Physical Activity	Member Agent reflect-and-route on "why movement?"
6	How Much Physical Activity Is Enough?	B-3 First 1,000 Miles dosing
7	Adopting an Active Lifestyle	Rebuild Foundation layer
8	Cardiorespiratory Endurance	B-3 cardio-specific direction
9	Vigorous Aerobic, Anaerobic, Sport, Recreational	B-1 Domain selection + C-3 Adventure Planning
10	Muscle Fitness and Resistance Exercise	B-3 strength-specific direction
11	Flexibility and Stretching Activities	B-5 Fuel Plan Recovery component
12	Advanced Fitness Training	C-3 Adventure Planning (Loop 2+ members)
13	Body Composition and Health	Weight-as-measuring-stick framing
14	Nutrition and Principles of Healthy Eating	B-5 Fuel Plan Nutrition component

15	Principles of Effective Weight Control	B-5 Fuel Plan + GLP-1 context
16	Stress and Health	Identity-loss-as-chronic-stress framing
17	Stress-Management Strategies	W-2 Self-Talk Audit, W-7 Failure Inventory, Reclaim integration
18-20	Tobacco, Alcohol, Other Drugs	Out of scope (substance use)
21	STIs	Out of scope
22	Cancer, Diabetes, Other Health Threats	Background for The Diagnosis door members
23	Body Mechanics and Care of the Back	B-5 Recovery + B-3 injury prevention
24	Making Informed Consumer Choices	HIDDEN GEM – Member Agent reflect-and-route on biohacking, supplements, GLP-1, longevity clinics
25	Toward Optimal Health and Wellness	C-3 Adventure Planning, C-5 Success Story, C-7 Cycle Closing

Two chapters worth flagging specifically

Chapter 3 is the keystone

Self-Management Skills for Health Behavior Change grounds the entire Rewire phase. The Lorig and Holman three tasks (medical, role, emotional) and six skills (problem-solving, decision-making, resource utilization, patient-provider partnership, action planning, self-tailoring) inform the Member Agent's conversational pattern. SDT autonomy / competence / relatedness map onto the 4Rs at the structural level. If Greg writes one G4L original first, deriving from Chapter 3 produces the highest leverage.

Chapter 24 is the hidden gem

Making Informed Consumer Choices is the citation-grade foundation for G4L's wellness-industry critique. The Member Agent will be asked by midlife members about biohacking, supplements, GLP-1 drugs, longevity clinics, and wearables. Greg's Chapter 24 content provides the evidence base for the agent's reflect-and-route on each. This synthesis (Topical Synthesis #7) anchors G4L's positioning against the optimization industry.

Five leverage points

Across the Program deliverables, five places carry disproportionate impact for the program. These are the places where Greg's contribution lands hardest and where the working agreement matters most.

1. Fuel Plan (B-5)

Five components: Sleep, Nutrition, Recovery, Environment, Energy Tracking. Four of the five sit inside Greg's textbook chapters. The Fuel Plan is one of the most operationally consequential assets – members live with it daily. Greg's contribution here informs the asset structure, the Science Check, and Topical Synthesis #6 (Fuel Plan deep dive).

2. False Start Protocol (W-5)

Behavior change science is Greg's wheelhouse. The False Start Protocol is the asset that makes the framework stick when motivation breaks – members use it in real time to recover from setbacks without abandoning the work. Greg's contribution here informs the Science Check, Topical Synthesis #1 (behavior change in midlife), and the underlying logic of how the protocol works.

3. IDQ Physical dimension

The Identity Distance Questionnaire's Physical dimension is anchored in Lorig and Holman's self-management model. Greg's contribution here informs the instrument design rationale, the Science Check for R-1 IDQ, and Topical Synthesis #2 (self-management for identity recovery). The Physical dimension is where members' physical reality enters the program's measurement architecture.

4. The Hardiness / Grinta distinction

Greg already articulates this in BP v6.1 – Hardiness as weathering the storm, Grinta as climbing after the storm passes, both trainable. Greg owns this conceptual ground. Topical Synthesis #4 makes the distinction the foundation of an applied-science argument that grounds the brand vocabulary.

5. The 60-day IDQ cadence rationale

Greg's voice in BP v6.1 already explains why 60 days: behavioral change literature shows meaningful identity-level shifts need that interval to register, and conversation preserves engagement better than form-based retakes. The Concept Map and the Science Check for R-1 IDQ formalize this rationale and make it part of the Member Agent's reflect-and-route when members ask why so often (or why so rarely).

What's already drafted (seed material)

Three sources of existing Greg-voice or Greg-derived content seed the Y1 work:

BP v6.1 Section IV-A-2

The "How it Works" section of the business plan contains Greg-voice material on Hardiness and Grinta, Self-Determination Theory, the Lorig and Holman self-management model, the Chronic Disease Self-Management Program, the Operational Definitions of Self-Management, and Motivational Interviewing alignment. This is the seed of the Concept Map. Greg can lift, adapt, and extend this content rather than rewriting from scratch.

The IDQ instrument design [GO TO DOCUMENT](#)

The 24-item IDQ across four dimensions (Physical, Self, Social, Outlook) was designed in consultation with Greg. The design rationale – why 24 items, why 6 per dimension, why this four-dimension structure – is partial Greg territory. The Concept Map captures and extends this rationale; the R-1 Science Check formalizes it for member-facing display.

Brand Standards – Greg's Applied Science Voice

Brand Standards v1.2 (in v1.3 progression) defines Greg's voice posture: applied science (not pure science), citation-anchored, connecting research to operational choices, brief inside Science Checks, signed where appropriate. The voice rules are written; Greg's authoring task is to populate the voice with content, not to invent the voice from scratch.

Reflect-and-route rules – the voice boundary

The Member Agent draws on Greg's content but does not impersonate Greg. This is a foundation-grade commitment in the AI Governance Framework and a core Brand Standards voice rule. The rules below govern how Greg's content shows up in the program.

Greg's voice appears in three places

- *Science Checks* inside the 12 gating assets. Greg-signed. The visible Greg voice. Members read these directly.
- *Greg AMA* – quarterly community event. Greg answers Member questions live or in recorded form. Direct Greg presence in the community.
- Grinta for Life book Foreword and embedded science chapters (Q1-Q2 2027). Greg's longer-form contributions to the second edition of the book.

Greg's voice does NOT appear in

- *Direct correspondence with members.* Those are Jay's emails. The Founder Agent drafts in Jay's voice, never Greg's.
- *Member Agent conversations.* The Member Agent speaks with the G4L voice (Member-facing register), not Greg's voice. If a member asks the agent a science question, the agent reflects Greg's content in G4L voice and routes the member to the Concept Map, the relevant Science Check, or the next Greg AMA. The agent does not say "Greg says..." as if quoting him.
- *Descriptions of what the framework does or how members experience it.* Those belong to Jay's voice and the G4L voice. Greg's voice describes the reasoning underneath the design, not the experience.

The distinction in practice

G4L voice (Member Agent): "The IDQ runs every 60 days. The framework gives the score time to move and gives you time to live between retakes."

Greg's applied science voice (Science Check, signed): "We chose 60 days because behavioral change literature shows meaningful identity-level shifts need that interval to register. We chose conversational administration because retention on form-based quarterly retakes drops after the second cycle."

Both voices say similar things. The G4L voice tells the member what is happening. Greg's voice tells the member (or the foundation) why the framework was designed this way. The two voices stay distinct.

Where Greg's content lives in the Member Agent

The Member Agent works in six layers of information at every conversation. Greg's contributions live in Layer 2 (Program Knowledge Corpus) as three named sub-corpora – the Concept Map, the 12 Science Checks, and the seven Topical Syntheses. The full data model is documented in the Member Agent Data Model diagram (companion document).

Greg's three sub-corpora – retrieval pattern

****Concept Map**** – retrieved when the agent needs the "why does the framework work this way" reflect-and-route. Indexed by Phase and asset.

****Science Checks**** – retrieved when a member encounters a specific gating asset. Indexed by asset code (R-1, R-4, R-6, W-1, W-3, W-5, B-1, B-3, B-5, C-1, C-3, C-5).

****Topical Syntheses**** – retrieved when a conversation goes deep on a specific subject. Indexed by topic (behavior change, hardiness, shortcut trap, SDT in midlife, etc.).

Retrieval is by member context, not by textbook chapter. This is why the Concept Map is G4L-keyed – the structure matches how the agent reaches for the content.

Delivery cadence

The Member Agent has the science layer fully populated from day one of platform launch rather than layering in across dates.

Deliverable	Detail
Concept Map (G4L-keyed, 10–15 pages)	Foundational. Informs everything else. Seeds the Science Checks and Topical Syntheses.
12 Science Checks (~200 words each)	These are member facing and align with the gated assets.
7 Topical Syntheses (1,500–3,000 words each)	Drafted in parallel with Science Checks. The shortcut trap and behavior change syntheses, prioritized as the most cited.
Review, edit, & sign off on all assets in the Atlas	This is the actual content/course content.
Second Edition Foreword (2,500–4,000 words)	Drafted alongside second-edition production. Lands before second edition release.

This cadence assumes Greg's summer bandwidth. Jay and Greg align on capacity in the brief review conversation; the timeline adjusts if bandwidth differs.

Questions for Greg – for the assignment-scoping conversation

This section names every question and dimension where Greg's feedback shapes the work. Walk through it together; capture answers and revisions in v1.2 of the brief.

Eleven topic areas, each with the specific questions worth surfacing. Greg's answers don't need to be final – they need to be heard and named, so the working agreement is grounded in his judgment from the start.

Q1. Review all 28 Assets in the Atlas plus IDQ [GO TO ATLAS DOCUMENTS](#)

- The assets have not been heavily reviewed or edited. Do the exercises make sense and will they support people on their journey? What's missing? Do they carry scientific weight? If not, what needs to be adjusted so they do? Are these written in a way that allows for IRB-type reporting and tracking so we can fulfill our goal of sharing research. What else do we need to consider there?

Q2. The Concept Map structure

- Does G4L-keyed organization (Phase / Layer / gating asset) work for you, or do you prefer textbook-section-keyed for authoring and a separate cross-reference for retrieval?
- Which Phase do you want to write first – Reconnect (the entry), Rewire (where behavior change literature concentrates), Rebuild (the most operationally consequential), or Reclaim (the integration)?
- Target depth per Phase section – pages, word count, or just "as much as the science warrants"?
- Citation style for the Concept Map – inline references with footnotes, end-of-section reference list, or hyperlinked source attribution?
- How do you want McGraw Hill's IP boundaries reflected – explicit "see Corbin et al. Chapter X for full treatment" pointers, or a separate references appendix?

Q2. The 12 Science Checks

- The 12 gating assets are locked (R-1 IDQ, R-4 Identity Excavation, R-6 Window Exercise; W-1 Disinformation Audit, W-3 Visualization Workshop, W-5 False Start Protocol; B-1 First Step Assessment, B-3 First 1,000 Miles, B-5 Fuel Plan; C-1 Reclaim Readiness, C-3 Adventure Planning, C-5 Your Success Story). Any gating asset you'd swap or add?
- The ~200 word target – does that feel like the right size for a Greg-signed callout, or do you want 300–400 words for the heavier-science ones (B-5 Fuel Plan, W-5 False Start Protocol)?
- Signature convention – "– Greg Welk" at the end, a small Greg avatar, both, neither?
- Update cadence – once per edition (annual), once per significant research finding, or quarterly review with the brand team?

Q4. The 7 Topical Syntheses

- The seven candidates: behavior change in midlife · self-management for identity recovery · SDT in the second half of life · hardiness and grit · physical activity assessment for midlifers · Fuel Plan deep dive · the shortcut trap. Any you'd drop or add?
- Order of authoring – which feels most foundational to write first?
- Length range – 1,500–3,000 words. Tight enough, or do some warrant 5,000+?
- Format – narrative essay, structured argument with sections, or annotated bibliography style?

Q5. The IDQ itself – the 24 items and their structure

- The four IDQ dimensions (Physical, Self, Social, Outlook) with 6 items each – does this allocation feel right, or should any dimension carry more weight? (Names locked from the May 2026 team brainstorm: Identity → Self, Relational → Social, Forward → Outlook.)
- The dimension anchoring – Physical = Lorig & Holman self-management; Self = SDT autonomy; Social = SDT relatedness; Outlook = SDT competence + intrinsic motivation. Solid? Any to revisit?
- The 60-day retake cadence – your read? Is there a citation that advocates for 60 vs. 90 vs. some other interval?
- Scoring math under the new convention: 6 items × 5 Likert = 30 raw per dimension; ID Score = sum of four = 0–120 raw (0–100 normalized for member-facing headline). Bands retire; display uses direction arrow + signed delta + raw number. Does the simpler math hold up scientifically?
- What policies and procedures do we need to follow to ensure we're adhering to IRB research subject rules? Confirm that you are the PI.

Q5. The 2x2 dashboard visualization

Some questions about the visual:

- The 2x2 projects four IDQ dimensions into two axes (Physical and Mental). Does this preserve diagnostic value at the surface, or does it lose too much?
- The Social question: Social is technically SDT-relatedness – connection with others, community belonging. Folding it into "Mental" alongside Self (self-recognition) and Outlook (intrinsic motivation) collapses different conceptual neighborhoods. Three options: (a) fold into Mental as mean-of-three, (b) Mental = Self + Outlook; Social surfaced separately as color overlay or companion indicator, (c) three-axis projection (harder to read). Your read?
- Axis scaling – the original -4 to +4 is retired. Cleanest option: 0–30 raw per dimension 1–5 likert for 6 questions under each dimension (matches the new scoring math). Or 0–100 normalized for headline display. Your preference?
- Educational content layer – when a member clicks into a dimension on the dashboard, they get a Greg-voice paragraph explaining what the dimension measures + 2–3 assets relevant to that dimension. Greg authors these per-dimension paragraphs as part of the Concept Map?
- Trajectory visualization – the 2x2 shows the member's path from intake to current position with dots and a connecting arc. The asymmetry of recovery becomes visible (e.g., Physical advancing while Mental lags). Does this visualization carry scientific weight or risk oversimplification?

Q6. The Pulse Check

- 3–5 items rotating dimension focus, every 30 days between IDQ retakes — is this an appropriate scope?
- Item bank composition — does Greg author the 30–50 candidate Pulse Check items, or review items drafted by the team?
- Signal strength computation (the Pulse Check produces a 0–100 indicator) — what's the right computation? Mean response, weighted by item severity, agent-interpreted, something else?
- Relationship to IDQ retake — should a strong Pulse Check signal accelerate the next IDQ retake, or do the cadences stay independent?

Q7. Cycle 2 onset and The Loop

- The three-path Identity Check-In at Cycle 2 onset (keep prior noun, hold compound, adopt new) — your read on the psychology? Is there a fourth path?
- How does Cycle 2 IDQ intake relate to Cycle 1 final? Tom v4.2 shows it drops back significantly (60 → 38) after a major life event. Is that the typical pattern, or does the framework expect smaller drops?
- Cadence for Cycle 2 — same 60-day IDQ retake interval, or different? Some literature suggests recovery accelerates after the first cycle.
- Visualization on the 2x2 — Cycle 1 trajectory fades, Cycle 2 begins from a new intake point. The Loop becomes visible. Does this rendering honor the lived experience?

Q8. The shortcut trap content (Chapter 24-derived)

- How aggressive should G4L be in critiquing biohacking, supplements, GLP-1 drugs, longevity clinics? Your Chapter 24 frames this carefully; G4L's tone tends sharper.
- Citation discipline — does this Topical Synthesis cite Chapter 24 directly, or paraphrase your arguments in G4L voice?
- The 67% GLP-1 rebound statistic in BP v6.1 — does that data hold up? Are there more current references?

Q9. The Foreword for the second edition

- 2,500–4,000 words aimed at sophisticated readers — appropriate length?
- Tone — research partner and co-founder, not a separate authority. Does that posture work for you, or do you want a more independent voice?
- Where do you want to start the argument — with Midlife Identity Loss as a public health category, with the framework's measurement architecture, with the author-pair model, or somewhere else?
